

Phosphorous

What's so bad about phosphates?

Healthy kidneys remove extra phosphorous

- When phosphorous builds up, it can harm your bones.
- High phosphorous can also lead to heart disease.
- Eating right can go a long ways towards reducing your risks.

NATURAL PHOS

Phosphorous is found naturally in protein-rich foods. You absorb 30–60% of natural phosphorous.

ADDED PHOS

Phosphorous is added to preserve processed foods. You absorb 90-100% of added phosphorous.

SERVING SIZES!

Fast foods present lots of phosphorous. Hold the cheese on that sandwich. Mix in fruit as a side.

Food Labels
Scan label ingredients and avoid "phos."

Check drink labels
Can be added to preserve and keep it mixed.

Avoid processed meats
One meat may have multiple phosphates added.
